

# The EverLink® DFW

## Dispatched Firewall

EverLink Dispatched Firewall (EverLink DFW) is one of Anyware Technology Inc's network security solutions. It uses a double-filtering technology to protect computers from outside-and-inside-the-network attacks. EverLink DFW not only effectively protects network servers and personal PCs from common outside-the-network attacks such as port scanning, sync-flood and ping attacks, but also protects the computers from inside-the-network attacks by malicious programs such as Trojan horses and network worms. It can prevent both known and unknown malicious programs from attacking your network and automatically update the block list. DFW also provides an easy-to-use network security platform for any enterprise with centralized security management. It works as effectively on laptops that are connected to an ISP, as it works on any corporate LAN connected desktops.

## Main Functions

### A. Firewall

#### Double Filtering Structure

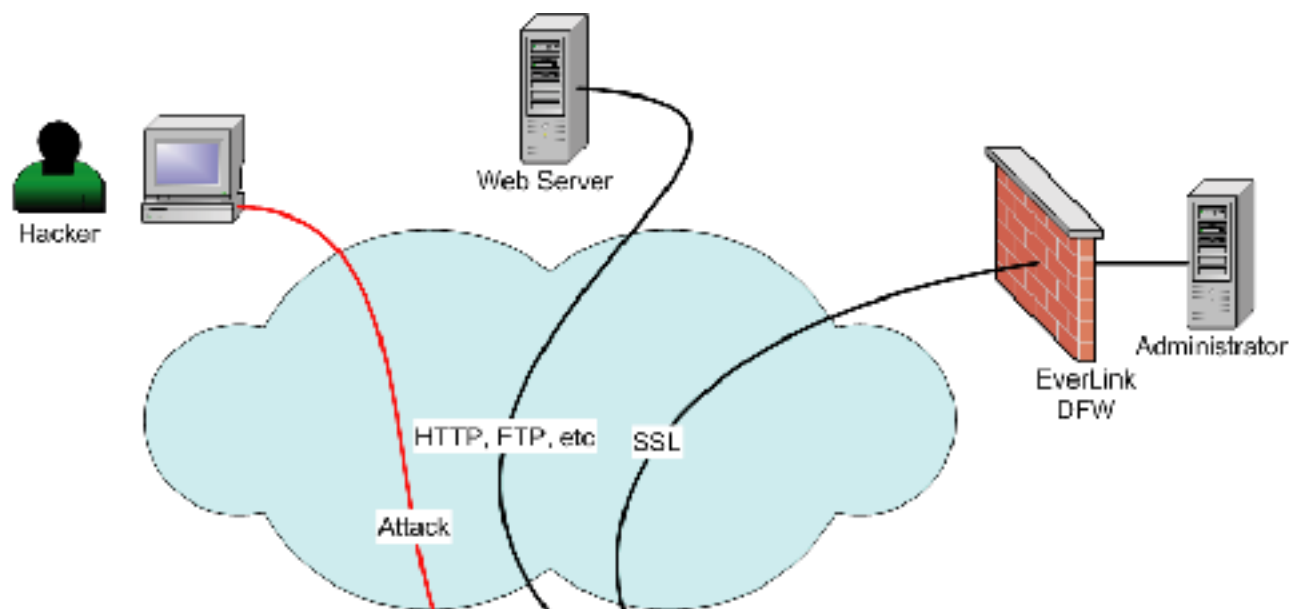

- Prevents Outside-the-Network Attacks
  - Packet-filtering
  - Stateful filtering
    - Prevents Sync-Flood attacks
  - Intrusion detection
    - Detects port scans
    - Prevents ping attacks
- Prevents Inside-the-Network Attacks
  - Trojan Horse filtering
    - Blocks known Trojan horses
    - Detects unknown Trojan horses and updates the block list

- Network-Worm filtering
    - Blocks known network worms
    - Detects unknown network worms and updates the block list
- User- or administrator-defined security policy  
 Real-time network monitoring  
 Comprehensive network activity logs

### B. Centralized Security Management Server

- PKI-based authentication for both users and security policy
- Policy transmission through SSL channel

## Demo

## Product Features

- Centralized security management
- Secure policy distribution
- Protects both Ethernet and Modem connections
- Intuitive GUI (Graphical User Interface)
- Works on MS Windows® platforms (Win98, ME, 2000, NT)
- On-line upgrade
