EverLink SRAC® (Secure Remote Access & Control) Gateway

EverLink SRAC (Secured Remote Access & Control) Gateway

- A Plug & Play Extranet
- A Compliment to VPN
- A Lower Cost Alternative to VPN

Challenges We All Face:

Companies today are facing the challenges of providing their mobile employees, vendors, customers and partners with secure remote access to their corporate information and applications. Currently IPSec VPNs are the most common practices used by most corporations to link their branch offices and mobile workforce.

Traditional IPSec VPNs are sound solutions for corporations to share information or applications among their branch offices, but they are inadequate in extending corporate resources to mobile employees, vendors, customers and partners. The remote access advantages associated with VPNs also bring up a great deal of cost and complexity issues. Among the facts: distribution and implementation of hardware and software clients more often than not create significant economic and technical burdens to evaluation, deployment, training, upgrading and support. The integration of security solutions with expensive internal applications and legacy systems poses serious challenge for any IT staff. In addition, integration of multi-vendor technologies can be a slow, costly, and complex process that is prone to errors. As a result of the impacts and limitations of VPNs, a significant number of enterprises consider them to be costly, complicated and even impractical.

To stay competitive by rapid delivery of information to different groups of users, companies must look for solutions that can be readily deployed without disrupting

their network infrastructure, and operated with a low total cost of ownership.

Our Solution:

- EverLink SRAC (Secure Remote Access & Control) Gateway from Anyware Technology - Security is no longer complicated or costly!

Designed with state of the art technology, EverLink SRAC Gateway is a high performance network appliance that integrates many security technologies into a simple network device. Operating at the application layer, the Gateway allows enterprises to build fully secured Virtual Private Network as easy as PLUG AND PLAY. By incorporating all authentication methods, including PKI and dynamic password, the Gateway provides the most thorough check of a user's identity. For those who have installed VPNs, the Gateway provides enterprises with significant added functionalities and security features to instantly accommodate mobile users anywhere in the world.

The Gateway offers a secure infrastructure without changing a corporation's existing IT infrastructure. It revolutionizes the mobile workforce by providing employees, vendors, partners and customers with a single, low cost, and easy-to-deploy secure remote access solution.

EverLink SRAC Gateway's key features:

Easy to Use

Remote users worldwide can securely access assigned local network resources such as files, database, terminal, email and web applications through any web browser. Users do not need to download or learn any new procedures.

Secure & Reliable

The EverLink SRAC Gateway is built on

innovative and reliable technology, which has been field-tested for security and functionality and is licensed for banking/ financial institutions, healthcare & medical practices, accounting & legal firms, and Application Service Providers (ASPs).

Easy to Deploy

Distinctively designed for high availability, the Gateway can be deployed as a plug & play appliance without any change to existing software, hardware, firewall, or network structure. Unlike a typical VPN solution, no installation of any client is required because it is based entirely on Java applet technology. Actual deployment time for the entire company can be within one hour.

Easy to Administer

Since there is no client installation, troubleshooting, upgrading, training and supporting requirements are very limited. Administration can easily be done at any time from anywhere through a friendly user interface on a web browser.

Simple to Control

At the outset, it is easy to mistake the EverLink SRAC Gateway as a VPN solution, however it is far more comprehensive. The centralized security management infrastructure makes the control of access to corporate resources easy to administer. Its granular access control feature allows the corporation to fully regulate remote access even down to which network applications an individual can use (user/group access control by IP address and protocol).

Easy to Scale

The EverLink SRAC Gateway scales easily into a cluster to accommodate tens of thousands of concurrent users (with load balancing if needed) and seamlessly interoperates with existing firewall infrastructure via open standards.
